Installing Complex Mobile Networks

The worldwide spread of mobile devices, such as smartphones and tablets using SNS, video streaming, etc., is causing an explosive increase in data traffic volumes. Mobile network base stations have various configurations; as well as shifting towards using smaller remote radio head (RRH) installations, optical fiber fault-finding and transport quality tests are required as the network environment evolves.

Installing the Transport Module MU100010A (10G Multirate)/MU100011A (100G Multirate) and OTDR Module MU100020A/MU100021A/MU100022A in the Network Master Pro MT1000A supports all-in-one optical-fiber fault finding and transport quality tests.

Using the MU100020A/MU100021A/MU100022A, scratched or dirty connectors at fiber cable connections can be detected as fault locations from the excessive optical reflections to support fault finding and troubleshooting of Mobile optical networks. Additionally, work efficiency is greatly improved using the Fiber Visualizer function supporting Easy-to-Use/Easy-to-Report testing.

- Supports three SM fiber (1310 nm/1550 nm) models (Standard, Enhanced, High-Performance)
- Supporting Construction using Multi-core Fiber Cables
- Supports other Mobile network applications

Network Master Pro MT1000A, OTDR Module MU100020A/21A/22A

All-in-One

Network I&M is supported by installing the MU100020A/MU100021A/ MU100022A and MU100010A/MU100011A in the MT1000A.

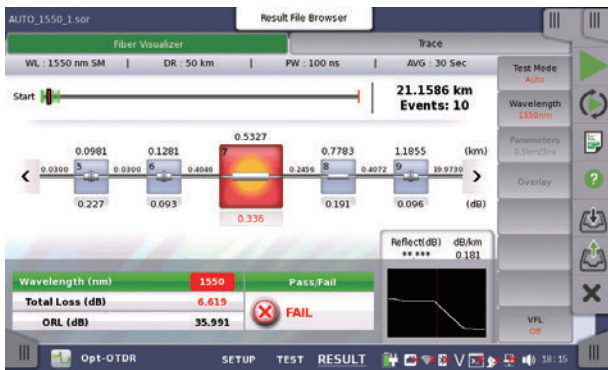

The OTDR Module lineup includes the MU100021A for OTDR measurements of both SM and MM fibers in high demand by the Mobile network I&M, plus the MU100020A/MU100022A for OTDR measurements of SM fiber used by PON networks and long-range measurements in Core/Metro networks.

With 10G/100G Multirate Module and OTDR Module

Easy-to-Use GUI

The MT1000A GUI design simulates onsite operations to help increase evaluation efficiency at network installation and to speed-up fault troubleshooting and isolation. Additionally, the intuitive user interface operations also help cut training time.

Easy-to-Read and Easy-to-Use 9-inch High-Resolution Touch Screen

The large 9-inch high-resolution, full-color, touch screen is easy to use and displays easy-to-read measurement results, helping improve onsite work efficiency.

Portable

All test functions required for network verification are built into the compact MT1000A cabinet for easy, all-in-one onsite support of most communications standards; the standard soft carry bag accessory is also ideal for carrying the MT1000A onsite.

Long Battery Life

Since AC power is not commonly available onsite, the MT1000A can run for up to 6 hours (with OTDR Module) on just one battery charge. And the optional car 12 Vdc adapter offers in-vehicle charging, helping facilitate uninterrupted work when moving between sites.

All-in-One Functions Required by Physical Layer I&M Tests

The MU100020A/MU100021A/MU100022A built-in light source and power meter functions can be used for optical loss tests in addition to OTDR tests. An optional (Option 002) visible light source can be installed as well.

Moreover, the presence of scratches and dirt on the fiber end face can be checked using the Video Inspection Probe (VIP).

Network Master Pro MT1000A, OTDR Module MU100020A/21A/22A

OTDR Module Applications

Generally, depending on the optical fiber measurement environment, OTDR measurements require multiple settings such as distance range, pulse width, measurement time, etc., making work difficult for technicians who do not generally use an OTDR. When performing Pass/Fail evaluation of an optical network for a report, a simple intuitive GUI is key to improving work efficiency.

The MU100020A/MU100021A/MU100022A emphasizes easy-to-understand operability using four application measurement modes: Standard OTDR Measurement, FTTA Measurement, Construction Mode and OLTS Measurement.

Standard OTDR Measurements

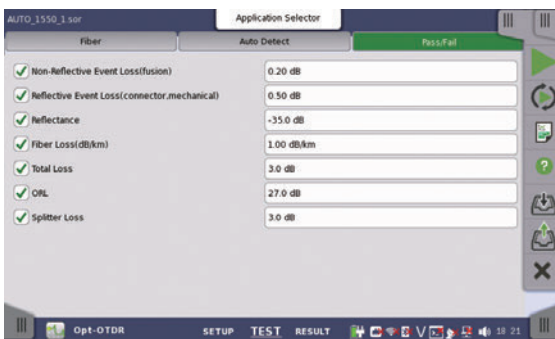

Graphical Display Based on Three-Window Operation: SETUP/TEST/RESULT

SETUP

This sets the measurement wavelength.

Other conditions, such as distance range, measurement time, etc., are measured at the Auto setting conditions.

TEST

This sets the detection conditions for optical fiber connectors and splices as well as the Pass/Fail evaluation threshold values, and starts measurement.

RESULT

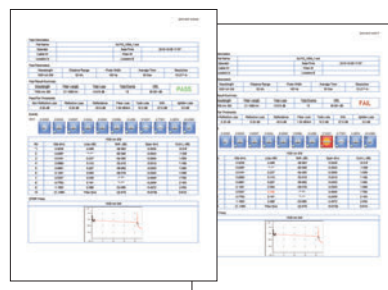

This displays the Pass/Fail evaluation results for each event graphically at the Fiber Visualizer screen.

Additionally, waveform analysis is supported by switching to the Trace screen.

One-Button Screen Switch

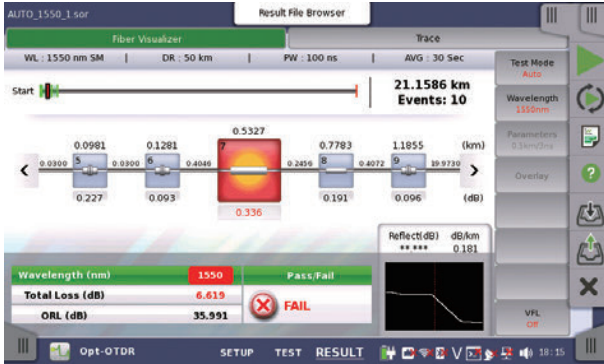

The measured data are output as a PDF report by an easy one-button operation.

OTDR Module Applications

1: Easy Pass/Fail Evaluation Using Fiber Visualizer

The OTDR measurement results are displayed as a trace showing the optical fiber length, losses and size of reflections, as well as an easy-to-view summary of the analysis results on the Fiber Visualizer screen.

Fiber Visualizer Screen

- Event icons showing characteristics of each connector, splice, and far end
- Pass/Fail evaluations based on user-settable threshold values

The user can set any threshold value for each event. If the Pass/Fail evaluation settings prescribed in the engineering manual are set beforehand, the measured optical fiber loss status can be easily distinguished visually at the same time as measurement ends.

2: Accurate Event Detection Using Multiple Pulse Widths

This function measures using multiple pulse widths during one measurement.

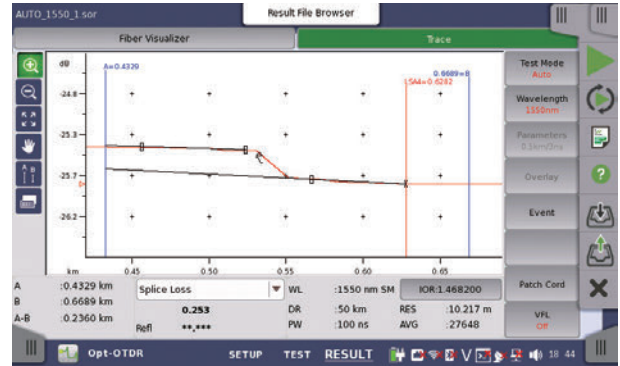

Optical networks are often composed of networks using fibers ranging in lengths from a few meters to several kilometers. Using the MU100020A/MU100021A/MU100022A multi-pulse technology for measurement gives much better and more accurate detection of events in short fibers than previous measurements.

Event Detection Using Multi-pulse Measurements

3: Intuitive Manual Waveform Analysis Using Touch Panel Operation

Using the Trace screen, it is also possible to perform manual analysis while moving the cursor on the captured waveform. Since the MT1000A has a touch panel, the optical fiber length, loss, and reflection attenuation can be analyzed manually using intuitive direct operations on the waveform.

Manual Analysis Screen

4: Supports Long-Distance Optical Fibers and PON Network Measurements with 1 × 128 Splitters

OTDR measurements of long optical fibers exceeding 100 km as well as PON networks including many splitters require an OTDR with high dynamic-range performance.

With its high dynamic range of 46 dB (typical), the MU100020A/MU100022A is ideal for evaluating Core/Metro/Access optical fiber networks.

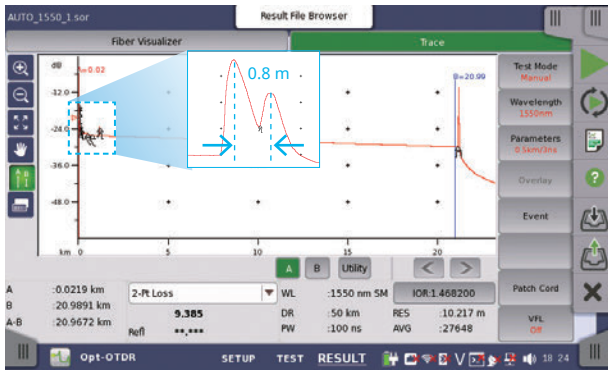

PON Measurement Screen

OTDR Module Applications

5: Various Functions and Performance for Precision OTDR Measurements

0.8-m Event Dead Zone

Events can be detected with a dead zone of just 0.8 m (typical). This is ideal for measurements in a mixed environment including short optical fibers, such as patch cords.

0.8-m Event Dead Zone

250,001 Sampling Points Max.

Up to 250,001 sampling points are supported, offering a minimum resolution of 2 cm, and a resolution of 2 m for a distance range of 300 km.

Optical Communications/Connection Check Functions

If an optical data signal is being input to the OTDR from an external source, the optical fiber connection status will be poor, making it impossible to perform accurate measurement and analysis. When an optical data signal is detected at the start of OTDR measurement using these functions, the optical fiber connection status is evaluated as poor, a warning is displayed, and measurement is stopped.

Supports OTDR Data Sharing Format

The measured waveform and analysis results data from the Fiber Visualizer and waveform screens are saved in the same common OTDR format described in the Telcordia SR-4731 (issue 2) standards. Not only can saved data be read by these instruments, it can also be read by the "NETWORKS" Analysis Software running on a PC.

*: The PC Analysis Software does not support the Fiber Visualizer function.

Macro Bend Detection/Analysis

Macro bends can be detected and analyzed by comparing two waveform (1310/1550/1625 nm) measurements using wavelength bend characteristics, permitting confirmation of bending faults in optical fibers, which is a difficult evaluation using measurement only one wavelength.

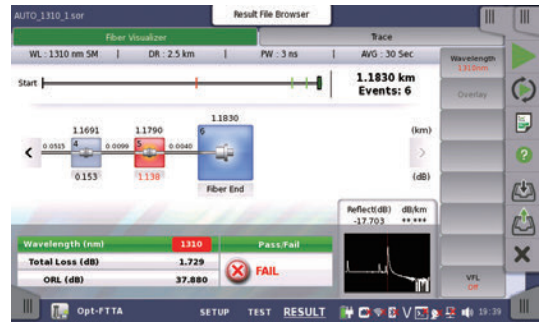

Multi-waveform Measurement and Display Functions

This is very convenient for comparison with saved waveform data captured at network commissioning as well as for comparison with abnormal waveform data, such as that captured at macro bend measurements.

FTTA Measurements

Comparatively short optical fibers of around several hundred meters in length are usually installed at the Mobile fronthaul FTTA. In this type of measurement environment, measurements made by different operators under different conditions commonly have inconsistency problems at later data processing. At FTTA measurement, the optical fiber installation measurement conditions are fixed previously, so measurements are always made under the same conditions. Like the OTDR measurement function, each measurement result can be analyzed at the Trace and Fiber Visualizer screens.

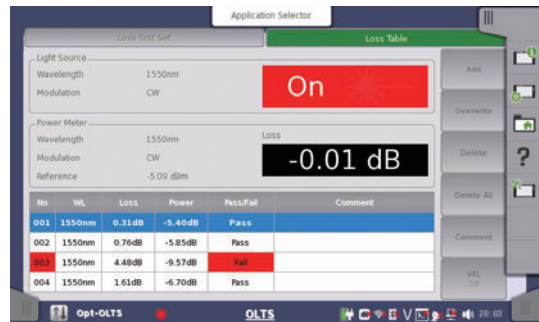

FTTA Measurements

OLTS Measurements

At measurement of the optical fiber, the first basic measurement is loss measurement using a light source and power meter. With a built-in light source and power meter as standard, the MU100020A/MU100021A/MU100022A can be used as an optical loss test set (OLTS). In addition, measurement results can be managed at the Loss Table for Pass/Fail evaluation of individual data based on set threshold values.

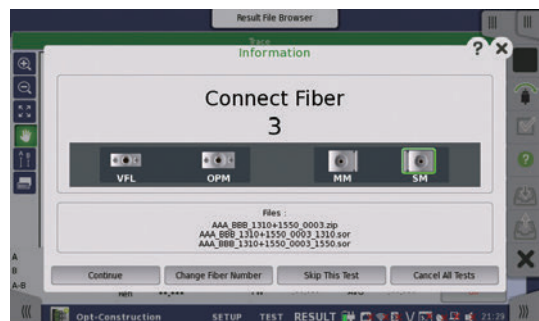

OLTS Measurement Loss Table

Construction Mode

The "Construction mode" simplifies installation work and is especially useful when pulling multi-core fiber cables. Work mistakes are eliminated by automated operation using pre-settings, such as project data (number of fibers, file names, etc.) and measurement conditions, to facilitate efficient measurement of multi-core fiber cables.

Construction mode

Other Shared Functions

Optical Connector End Face Inspection

This function is for analyzing the presence and state of scratches and dirt on the fiber end face, which are one factor causing degraded optical communications quality. Additionally, connecting a dirty or scratched optical fiber directly to an OTDR can prevent Pass/Fail evaluation of a previously normal fiber.

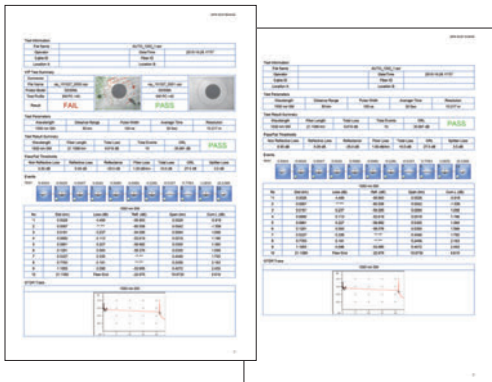

The MT1000A has a built-in VIP utility menu for analyzing the end face of optical connectors. When the external optical fiberscope (G0382A USB Autofocus type, G0306B USB Standard type: sold separately) is connected, scratches and dirt on the optical connector end face can be confirmed visually. Pass/Fail evaluation of the end-face status is performed according to the IEC61300-3-35 standard.

Optical Fiber End Face Inspection Screen

PDF Report Output

OTDR/FTTA measurement results can be output as a PDF report. In addition to the summary display, the Fiber Visualizer event icons, event table, and a waveform display can also be output. This is useful for easy confirmation of the Pass/Fail evaluation status. In addition, files obtained by VIP measurement can also be read as well, creating a single convenient report.

PDF Report

Remote Operation Function

The OTDR Module MU100020A/MU100021A/MU100022A can also be operated remotely from a PC over a VNC connection via Ethernet.

*: The Windows Control Software MX100001A does not support this operation for OTDR modules.

Simultaneous Visible Light Option/Optical Power Meter Measurements

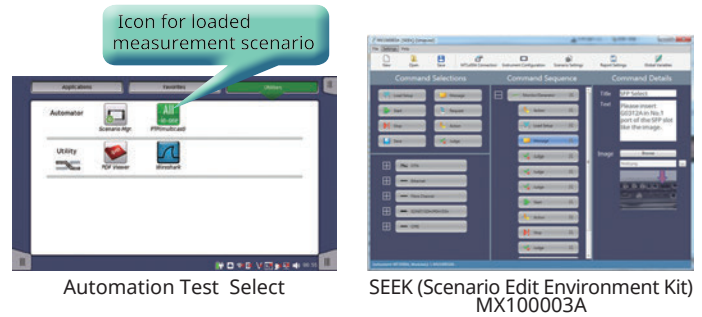

The visible light option (Option 002) can be used jointly with each of the Standard OTDR, FTTA, Construction and OLTS applications, making it possible to visually confirm breaks in the optical fiber. Furthermore, the Standard OTDR, FTTA and Construction applications can also be used jointly with an optical power meter, increasing work efficiency when measuring multi optical fibers.

OTDR Operation with Optical Power Meter

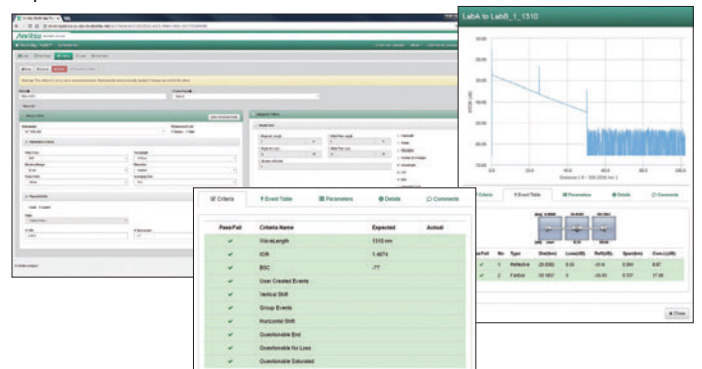

Value of Offering Automatic Measurement Solutions

Simplifies multiple testing work, shortens on-site test time, and eliminates human operation errors. Supports simultaneous multiple tests. Download free editing software (MX100003A) to create scenarios without need for programming skills.

SkyBridge Tools™ Test Manager

SkyBridge Tools™ is a cloud-hosted management system for test equipment and trace management. Support for one-button testing cuts test times by up to 90% by simplifying procedures and eliminating errors. SkyBridge also reduces engineering involvement, provides immediate project visibility to all involved with clear visibility of results through dashboards and output of report-friendly results in multiple formats. SkyBridge supports the Network Master Pro (MT1000A) OTDR module with automated test plans; it creates OTDR measurement scenarios for Pass/Fail evaluation and outputs result reports.

100G Multirate Module MU100011A

Installing the MU100010A or MU100011A in the MT1000A supports commissioning and maintenance tests of communications networks operating at speeds from 1.5 Mbps to 100 Gbps. In addition to Ethernet, OTN, etc., networks, the CPRI, OBSAI, and SyncE protocols used by mobile-network base stations are supported too.

CPRI RF Module MU100040B

Installing the CPRI RF Module MU100040B in the MT1000A supports analysis of IQ signal frequency characteristics included in CPRI signals between the LTE base station RRH and BBU. This can be used to check operation of the RRH after installation. MU100040B supported BBU emulation for RRH.

Network Master Flex MT1100A
